

TIME ANALYSIS

IN CONJUNCTION WITH ELLIOTT WAVE THEORY

By : Manoj Kumar

The following points contain the A-Z of the timeframes we should consider while applying time for various concepts learnt so far in Elliot Wave Theory (both Impulse and Corrections)

1. Timelines Related to Impulse Study

A) In case of **Microscopic Waves** (Wave 1 and Wave 2), they can be formed in 3-5 candles only.

B) Wave 2 will never take Thrice the time of Wave 1 or more, though it may take anywhere between 2-3 times.

C) In case of a **Trending Nature**, Wave 3 takes the same time as that of Wave 1 in an ideal case scenario.

D) In case of a **Terminal Nature**, Wave 3 can take double the time of Wave 1.

E) Normally, Wave 3 takes the timing of Wave 1 & Wave 2 combined with an overlapping of 5 candles.

F) In case of a **leading diagonal**, Wave -4 (sub-wave of Degree 1) should enter territory of Wave 1 (again sub wave of Degree 1) and in half or max 1/4th time that of Wave 2.

G) In case of Wave 5, we have two different options, that is, we measure the equality of Wave 1 and Wave 3. It will fulfill one of them with minimum 127% target as the first priority.

TIME ANALYSIS

IN CONJUNCTION WITH ELLIOTT WAVE THEORY

By : Manoj Kumar

H) If Wave 1 and Wave 2 are microscopic in nature, then Wave 4 may be complex in nature and it can be up to 5 times of Wave 2nd.

- I) a. Time taken by Wave 4 to Wave 5, if the price falls in the same time frame, then the entire “Pattern gets Confirmed” (Wave Completion)
- b. If the time taken is more, it is a Buying Opportunity.
- c. And if it takes lesser time, then it creates “Panic” it is a sell indicator.

J) If the fall from Wave 4 to Wave 5 takes half the time to break the 2-4 Trendline (also known as Maturity Trendline), then it is considered as a “**Reversal**” which we prioritize over pattern confirmation. If both happen simultaneously, then it creates “PANIC”. Although it must be noted that First Reversal is Confirmed, and then Pattern is Confirmed.

K) As per the **Rule Of Equality**, the time period & height is the same in case Wave 1 and Wave 3 in an ideal case. If the same is more than 161.8%, then it is beneficial for us, equality to be given priority.

L) When Wave 1 and Wave 3 are same timewise and Wave 5 is in extension, it is known as “**Megaphone**”.

TIME ANALYSIS

IN CONJUNCTION WITH ELLIOTT WAVE THEORY

By : Manoj Kumar

II) TIMELINES Related to CORRECTION Study .

M) In case of a Zig-Zag or Flat Correction **Timing of B** = Timing of A or B can take max **5 times** that of Wave A.

N) Timing of C in Flat or Zig-Zag Correction can be Equal to A or Timing of **C = (A+B)/2**.

O) Time taken by X will be Half of W in an ideal case, that is, $(A+B+C)/2$ or less since it's a Missing Wave. Although if it's less than the timing of W, we will still consider it as X only.

P) Timing of Y = $(\text{Time of B to C leg in W} + \text{Time of X})/2$ (Note : pls read carefully again)

Q) Trend Reversal in a Double Correction is considered if 0 to X trendline is broken within half the time taken from X to Y “or” if the reversal from Y to X happens in the same time as X to Y.

TIME ANALYSIS

IN CONJUNCTION WITH ELLIOTT WAVE THEORY

By : Manoj Kumar

II) TIMELINES Related to CORRECTION Study .

R) Pattern Confirmation in a Single Correction:

- Calculate the Time Taken from B to C.
- If the Top of Point B is broken in the same time or less time, then pattern is confirmed.

S) Trend Reversal in a Single Correction:

In case of a **Single Correction** (A-B-C), the reversal will be considered if the 0-B trendline is broken in half the time taken by B to C. It can indicate a change of trend or end of correction.

T) In case of a **Triangular Correction**, timing for entire move can 5 times that of Wave 0 to Wave A (till Wave E)

U) Timing for breakout of trendline for B to D will be same as that of Wave E in case of a Triangular Correction.

V) Time Study related to gaps: a. Common Gaps are found in Wave 1, Wave-2, Wave -4, Wave A, Triangle Correction as well as in X and Y. They get filled in max 5 days. b. Breakaway Gap is found in Wave 3. Can take min 3 months to max 3 years to get filled. c. Exhaustion Gap is found in Wave 5 or Wave C or Wave C of "Y" or Wave C of "Z".

STRUCTURE OF WAVE 2

II) TIMELINES Related to CORRECTION Study .

R) Pattern Confirmation in a Single Correction:

- a. Calculate the Time Taken from B to C.
- b. If the Top of Point B is broken in the same time or less time, then pattern is confirmed.

S) Trend Reversal in a Single Correction:

In case of a **Single Correction** (A-B-C), the reversal will be considered if the 0-B trendline is broken in half the time taken by B to C. It can indicate a change of trend or end of correction.

T) In case of a **Triangular Correction**, timing for entire move can 5 times that of Wave 0 to Wave A (till Wave E)

U) Timing for breakout of trendline for B to D will be same as that of Wave E in case of a Triangular Correction.

V) Time Study related to gaps: a. Common Gaps are found in Wave 1, Wave-2, Wave -4, Wave A, Triangle Correction as well as in X and Y. They get filled in max 5 days. b. Breakaway Gap is found in Wave 3. Can take min 3 months to max 3 years to get filled. c. Exhaustion Gap is found in Wave 5 or Wave C or Wave C of "Y" or Wave C of "Z".

STRUCTURE OF MOVE 2

STRUCTURE OF SECOUND MOVE

What happens when you pay attention to time: -

Sometimes there is no need for complicated wave counts and it will help you during trading

- Time is Significant in the correct formation of waves and prevents incorrect counting

Mr. Elliott, at the beginning, had discovered basic things about wave timing,

such as:

-Two waves in an impulse pattern that are not extended often have almost equal time - A and C waves tend to have the same time

But Mr. Neely's rules, which are presented in a general way, apply to all patterns

STRUCTURE OF MOVE 2

STRUCTURE OF SECOUND MOVE

1- If the middle wave of a pattern like a zigzag has less time than the two waves before and after it, we can say that this wave can:

- X-wave
- Wave 2 of a terminal pattern
- Wave B Of the Reverse Alternation Contracting Triangle

OR

if the previous wave has not returned more than 61.8%, it is diametric or symmetrical one.

Tip:

Which pattern in the wave in the chart may occur depends on the pattern of larger degree (higher time frame).

STRUCTURE OF MOVE 2

2- Except for the patterns in **case 1**, in the rest of the patterns, the middle of the wave must have at least the same as the wave before it.

3- Generally, the time of the middle wave or the second wave of any pattern is equal to 161.8 to 261.8% of the previous wave.

STRUCTURE OF MOVE 2

2. STRUCTURE OF SECOUND MOVE

4- If the time of the middle wave is **more than 261.8%** of the wave before it, this is not common at all and can only be seen in flats and rare patterns.

Tip:

The usual wave B in the flats is between 2 and 4 times that of wave A (that is, if the time of wave A is 10 days, the time of wave B will be between 20 and 40 days). The time of wave B can never be rare than 6 times of wave A

5- If in three consecutive waves. for example similar to zigzag, the third wave spends a lot of time for the return of wave 2 (middle wave), we realize that a powerful movement and a new wave has not yet started, and the third wave is a part of the second wave. And it is part of a larger correction.

STRUCTURE OF MOVE 2

2. STRUCTURE OF SECOND MOVE

OR

the third wave can be a terminal pattern, which depends on the time Of the second wave compared to the first wave. If the time of the second wave is equal to or longer than the first wave, the terminal can occur.

Tip:

It is very important that if the important if the movement after a pattern or correction wave cannot return in a less than or equal to the time of the pattern or correction wave, it that the trend is weak and probably the correction pattern has not yet ended, or The wave count was not correct.

STRUCTURE OF MOVE 2

6- If we have three consecutive waves, for example, similar to a zigzag, the third wave has a faster acceleration than the first wave and is larger than the first wave in terms of price, in this case, we place the beginning of the market movement and the new bottom at the beginning of the third wave and label The setting changes.

Tip:

It is very important that if the important if the movement after a pattern or correction wave cannot return in a less than or equal to the time of the pattern or correction wave, it that the trend is weak and probably the correction pattern has not yet ended, or The wave count was not correct.

STRUCTURE OF MOVE 2

7- In three consecutive waves. if the time of the third wave is equal to the first wave, it indicates that the wave has not yet ended.

The time of the third wave is usually as follows:

$$(\text{Wave 1/a} + \text{Wave b/2})/2 = \text{wave 3 /c}$$

According to the rules of the section, you can recognize the end of correction patterns, the beginning of movements and the end of wave 3 or c.

These rules are most effective during trading

8-

(a)- If the first and second waves are equal in terms of time, then the time of the third wave will be

$$A + B = C \text{ wave time}$$

STRUCTURE OF MOVE 2

2. STRUCTURE OF SECONDD MOVE

(b)- If the middle wave (the second wave) is much longer than the first wave in terms of time, the time of the third wave will be equal to the first wave or 161.8% of the first wave.

A + C = B wave time

Tip:

Tip: The most common type of flat pattern is that waves A and C are equal in time, while wave B is much longer in time than waves A and C.

STRUCTURE OF MOVE 2

2. STRUCTURE OF SECOUND MOVE

(c)- If none of the waves are equal in terms of time, they are usually related to each other by the ratio of 38.2 and 61.8, and in this ratio we see the reaction of the waves.

Wave A + wave B = C wave time

Tip:

In this case, if the time of wave B is not much longer than the time of wave A, the time of wave c will be same as (a)

STRUCTURE OF MOVE 2

How time will help you :

For example, if we have three wave that have the same time , if we count as follow , we made a mistake

STRUCTURE OF MOVE 2

How time will help you :

For example, if we have three wave that have the same time , if we count as follow , we made a mistake

When three waves have the same time, we are told that the pattern is not yet complete

STRUCTURE OF MOVE 2

How time will help you :

The Correct is as Follow

STRUCTURE OF MOVE 2

Exception:

Sometimes you will a large candlestick appear on the chart due to important news These types of candles or price gaps are among the exceptions and the mentioned time rules do not apply to these types of candles, because in fact, these candles cause new movements and patterns in the market. These candles should be expensive, long and have good power.

Another exception is that, for example, sometimes you identify a zigzag or flat pattern whose wave C is targeted by a large candlestick in a shorter time than the usual time of wave C, there is no problem here either.

Time rules is not necessary here Another exception is that, for example, sometimes you identify a zigzag or flat pattern whose wave C is targeted by a large candlestick and in a shorter time than the usual tinne of wave C, there is no problem here either. Time rulse is not necessary
